

I oppose BPL (Access BPL). Japan, England and others have identified interference problems with BPL technology and rejected recently.

It is clear that keeping the signals 'on the line' rather than radiated is unlikely at best. Interference in the average home is likely.

Public safety agencies, the military, operators of long-range aircraft, television and shortwave broadcasters, and amateur radio operators are all concerned that BPL could interfere with their communications.

As an Amateur Radio operator, I already have enough interference from an electric grid that is in need of repair and maintenance. Please don't make it worse than it already is.
